

Centralising Group Management Reporting

for Consulting & Professional Services

Sector: Consulting and Professional Services · Client: Confidential, International — offices across EU, USA, UK and Asia

Challenge

This client group holds various consulting businesses, alongside several other propositions in professional services related operations under the same ownership. Despite operating as one group, they had no reliable, shared view of how the group as a whole was performing. Financial reporting, sales forecasting, resource utilisation, productivity and product delivery status all lived in separate, inconsistent formats across the different businesses. There was no single place anyone could look to see group revenue, profit, forecasts or history. Dashboards also only updated once a day, so leadership teams across multiple jurisdictions were often looking at figures that were already hours out of date compared to each other — and the reports themselves weren't giving leadership what they needed.

Solution

We designed and built a unified management dashboard that pulled financial reporting, forecasting, resource utilisation, productivity and product status into one group-wide view. The system had to work across multiple legal entities and jurisdictions, not just a single office, so it was built with that complexity in mind from the start. We worked closely with the Group CFO and in-country Finance Directors to understand what the existing reports were meant to achieve, checked the integrity of the underlying data, and rebuilt the reporting so every business unit internationally could see live figures rather than a single daily snapshot.

Effects

The group now has one source of truth for revenue, profit, forecasts, actuals and historical performance across all its businesses. Reporting is consistent across jurisdictions instead of varying office by office, and the dashboard was built to hold up against the layered regulatory and compliance requirements of running an international professional services group. Feedback from business leads has been consistently positive, and the engagement surfaced a bigger strategic opportunity — an active board-level conversation on enterprise and data architecture, with the relationship moving toward an ongoing advisory arrangement.
